

IN THE CLAIMS:

Please amend claims 2-4, 20, 21-23, 25, 26, 28, 46, and 47 as follows.

1. (Cancelled)

2. (Currently Amended) A method according to claim 14, wherein the mobile subscriber identification data ~~consist of~~comprises a mobile subscriber international integrated services digital network ISDN-number mobile station international subscriber directory numbermsisdn.

3. (Currently Amended) A method according to claim 14, wherein in connection with the check, further comprising:

sending a query ~~is sent to~~ the home location register of the mobile communications system.

4. (Currently Amended) A method according to claim 3, wherein the mobile subscriber identification data ~~consist of~~comprises the mobile subscriber international integrated services digital network ISDN-number, and the method further comprising:

searching ~~with the query first the home location register of the mobile communications system is searched for~~ the international mobile subscriber identity international mobile subscriber identity IMSI ~~corresponding to the mobile subscriber~~

international integrated services digital network ISDN-number with the query first the
home location register of the mobile communications system; and then

searching with the international mobile subscriber identity the home location
register of the mobile communications system is searched for the related subscriber data,
where the access right is defined, with the international mobile subscriber identity the
home location register of the mobile communications system.

5. (Previously Presented) A method according to claim 14, wherein the password is transmitted to the subscriber terminal in a packet-switched message.

6. (Previously Presented) A method according to claim 14, wherein the password is transmitted to the subscriber terminal in a short message.

7. (Previously Presented) A method according to claim 14, wherein the data transfer connection between the data transfer device and the service access point is a radio link.

8. (Previously Presented) A method according to claim 7, wherein the radio link is implemented using a wireless local area network.

9. (Previously Presented) A method according to claim 7, wherein the radio link is implemented using a short-range radio transceiver.

10. (Previously Presented) A method according to claim 14, wherein the data transfer connection between the data transfer device and the service access point is wired.

11. (Previously Presented) A method according to claim 14, wherein the method further comprises:

billing for the data transfer connection between the data transfer device and the service access point in a bill directed to the identification data of the mobile subscriber.

12. (Previously Presented) A method according to claim 14, wherein the data transfer connection initially set up between the data transfer device and the service access point is maintained until login.

13. (Previously Presented) A method for authenticating a user of a data transfer device, comprising:

setting up a data transfer connection from the data transfer device to a service access point;

inputting identification data of a subscriber of a mobile communications system to the service access point;

checking from the mobile communications system whether the mobile subscriber identification data contains an access right to the service access point;

if a valid access right exists, generating a password, transmitting the password to a subscriber terminal corresponding to the mobile subscriber identification data, and logging in to the service access point from the data transfer device using the password transmitted to the subscriber terminal; and

transmitting a second password from the service access point to the data transfer device over a data transfer connection, the second password being also used in connection with login.

14. (Previously Presented) A method for authenticating a user of a data transfer device, comprising:

setting up a data transfer connection from the data transfer device to a service access point;

inputting identification data of a subscriber of a mobile communications system to the service access point;

checking from the mobile communications system whether the mobile subscriber identification data contains an access right to the service access point;

if a valid access right exists, generating a password, transmitting the password to a subscriber terminal corresponding to the mobile subscriber identification data, and

logging in to the service access point from the data transfer device using the password transmitted to the subscriber terminal; and

transmitting a confirmation identifier from the service access point to the data transfer device over a data transfer connection and transmitting the same confirmation identifier to the subscriber terminal together with the password, the password being only used if the received confirmation identifiers are the same.

15. (Cancelled)

16. (Previously Presented) A method for authenticating a user of a data transfer device, comprising:

setting up a data transfer connection from the data transfer device to a service access point;

inputting identification data of a subscriber of a mobile communications system to the service access point;

checking from the mobile communications system whether the mobile subscriber identification data contains an access right to the service access point;

if a valid access right exists, generating a password, transmitting the password to a subscriber terminal corresponding to the mobile subscriber identification data, and logging in to the service access point from the data transfer device using the password transmitted to the subscriber terminal, wherein the data transfer connection between the

data transfer device and the service access point is set up when the subscriber terminal is roaming;

informing the subscriber terminal that if the roaming by the subscriber terminal in the visited mobile communications system fulfils a predetermined criterion, the data transfer connection from the data transfer device to the service access point is provided at a lower charge than usual; and

implementing the data transfer connection from the data transfer device to the service access point at a lower charge than usual if the predetermined criterion is met.

17. (Previously Presented) A method according to claim 16, wherein the method further comprises:

receiving at the visited mobile communications system information from the subscriber terminal indicating that a lower charge data transfer connection to the service access point is preferred.

18. (Previously Presented) A method according to claim 17, wherein the method further comprises:

receiving at the authentication server information from the visited mobile communications system indicating that the data transfer device of the user of the subscriber terminal will be provided with a lower charge data transfer connection to the service access point.

19. (Previously Presented) A method according to claim 16, wherein the predetermined criterion is met if the subscriber terminal contacts the visited mobile communications system and/or if the subscriber terminal continues roaming in the visited mobile communications system for a predetermined time.

20. (Currently Amended) A method according to claim 16, wherein to check whether the predetermined criterion is met, the method executes a periodic query ~~is made~~ to the home location register of the mobile subscriber's home mobile communications system.

21. (Currently Amended) A method according to claim 14, wherein the method further comprises:

using the mobile subscriber identification data as a user ~~ID~~-identification in connection with login.

22. (Currently Amended) A method for authenticating a user of a data transfer device, comprising:

setting up a data transfer connection from the data transfer device to a service access point;

inputting identification data of a subscriber of a mobile communications system to the service access point;

checking from the mobile communications system whether the mobile subscriber identification data contains an access right to the service access point;

if a valid access right exists, generating a password, transmitting the password to a subscriber terminal corresponding to the mobile subscriber identification data, and logging in to the service access point from the data transfer device using the password transmitted to the subscriber terminal; and

transmitting a user ~~ID~~-identification to the subscriber terminal corresponding to the mobile subscriber identification data and using the transmitted user ~~ID~~-identification in connection with login.

23. (Currently Amended) A method for authenticating a user of a data transfer device, comprising:

setting up a data transfer connection from the data transfer device to a service access point;

inputting identification data of a subscriber of a mobile communications system to the service access point;

checking from the mobile communications system whether the mobile subscriber identification data contains an access right to the service access point;

if a valid access right exists, generating a password, transmitting the password to a subscriber terminal corresponding to the mobile subscriber identification data, and logging in to the service access point from the data transfer device using the password transmitted to the subscriber terminal; and

transmitting a user ~~ID~~identification to the data transfer device over a data transfer connection and using the transmitted user ~~ID~~identification in connection with login.

24. (Cancelled)

25. (Currently Amended) A system according to claim 38, wherein the identification data of the subscriber of the mobile communications system ~~consist of~~ comprises the mobile subscriber international integrated services digital network~~ISDN~~.

26. (Currently Amended) A system according to claim 38, wherein the authentication server is an ~~Authentication, Authorization and Accounting~~ AAAauthentication, authorization, and accounting server.

27. (Previously Presented) A system according to claim 38, wherein for checking the access right to the service access point, the authentication server is configured to transmit a query to the home location register of the mobile communications system.

28. (Currently Amended) A system according to claim 27, wherein the identification data of the subscriber of the mobile communications system ~~consist of~~comprises the mobile subscriber international integrated services digital network ISDN number, and the authentication server is configured to submit the query to first search the home location register of the mobile communications system for the international mobile subscriber identity corresponding to the mobile subscriber international integrated services digital network ISDN-number and then use the international mobile subscriber identity to search the home location register of the mobile communications system for the related subscriber data, where the access right is defined.

29. (Previously Presented) A system according to claim 38, wherein the authentication server is configured to transmit the password to the subscriber terminal in a packet-switched message.

30. (Previously Presented) A system according to claim 38, wherein the authentication server is configured to transmit the password to the subscriber terminal in a short message.

31. (Previously Presented) A system according to claim 38, wherein the first data transfer connection is a radio link.

32. (Previously Presented) A system according to claim 31, wherein the service access point is configured to implement the radio link using a wireless local area network.

33. (Previously Presented) A system according to claim 31, wherein the service access point comprises a short-range radio transceiver for implementing the radio link.

34. (Previously Presented) A system according to claim 38, wherein the first data transfer connection is wired.

35. (Previously Presented) A system according to claim 38, wherein the system further comprises an accounting server, which is configured to generate the billing data relating to the first data transfer connection and to transfer the data to the mobile communications system, in which the billing data are formed into a bill associated with the identification data of the subscriber of the mobile communications system.

36. (Previously Presented) A system according to claim 38, wherein the service access point is configured to maintain the first data transfer connection initially set up between the data transfer device and the service access point until login.

37. (Previously Presented) A system configured to authenticate a user of a data transfer device, comprising:

a data transfer device;

a service access point that can be linked to the data transfer device over a first data transfer connection; and

an authentication server linked to the service access point over a second data transfer connection,

wherein

the service access point is configured to receive over the first data transmission connection identification data of a subscriber of a mobile communications system inputted from the data transfer device and to transmit the mobile subscriber identification data to the authentication server over the second data transfer connection,

the authentication server is configured to check from the mobile communications system over a third data transfer connection whether the mobile subscriber identification data contains an access right to the service access point and, if a valid access right exists, to generate a password and transmit the password to a subscriber terminal corresponding to the identification data of the subscriber of the mobile communications system,

the data transfer device is configured to use the password transmitted to the subscriber terminal in connection with login to the service access point, and

the authentication server is configured to transmit a second password from the service access point to the data transfer device over the first data transfer connection and

the data transfer device is configured to also use the second password in connection with login.

38. (Previously Presented) A system configured to authenticate a user of a data transfer device, comprising:

a data transfer device;

a service access point that can be linked to the data transfer device over a first data transfer connection; and

an authentication server linked to the service access point over a second data transfer connection,

wherein

the service access point is configured to receive over the first data transmission connection identification data of a subscriber of a mobile communications system inputted from the data transfer device and to transmit the mobile subscriber identification data to the authentication server over the second data transfer connection,

the authentication server is configured to check from the mobile communications system over a third data transfer connection whether the mobile subscriber identification data contains an access right to the service access point and, if a valid access right exists, to generate a password and transmit the password to a subscriber terminal corresponding to the identification data of the subscriber of the mobile communications system,

the data transfer device is configured to use the password transmitted to the subscriber terminal in connection with login to the service access point, and

the authentication server is configured to transmit a confirmation identifier via the service access point to the data transfer device over the first data transfer connection and to transmit the same confirmation identifier to the subscriber terminal together with the password.

39. (Cancelled)

40. (Previously Presented) A system configured to authenticate a user of a data transfer device, comprising:

a data transfer device;

a service access point that can be linked to the data transfer device over a first data transfer connection; and

an authentication server linked to the service access point over a second data transfer connection,

wherein

the service access point is configured to receive over the first data transmission connection identification data of a subscriber of a mobile communications system inputted from the data transfer device and to transmit the mobile subscriber identification data to the authentication server over the second data transfer connection,

the authentication server is configured to check from the mobile communications system over a third data transfer connection whether the mobile subscriber identification data contains an access right to the service access point and, if a valid access right exists, to generate a password and transmit the password to a subscriber terminal corresponding to the identification data of the subscriber of the mobile communications system,

the data transfer device is configured to use the password transmitted to the subscriber terminal in connection with login to the service access point,

the first data transfer connection is set up when the subscriber terminal is roaming, and

the visited mobile communications system is configured to inform the subscriber terminal that if the roaming by the subscriber terminal in the visited mobile communications system fulfils a predetermined criterion, the data transfer connection from the data transfer device to the service access point is provided at a lower charge than usual, and the authentication server is configured to implement the data transfer connection from the data transfer device to the service access point at a lower charge than usual if the predetermined criterion is met.

41. (Previously Presented) A system according to claim 40, wherein the visited mobile communications system is configured to receive from the subscriber terminal information indicating that a data transfer connection to the service access point provided at a lower charge than usual is preferred.

42. (Previously Presented) A system according to claim 41, wherein the authentication server is configured to receive from the visited mobile communications system information indicating that the data transfer device of the user of the subscriber terminal will be provided with a data transfer connection to the service access point implemented at a lower charge than usual.

43. (Previously Presented) A system according to claim 40, wherein the predetermined criterion is met if the subscriber terminal contacts the visited mobile communications system and/or if the subscriber terminal continues roaming in the visited mobile communications system continues for a predetermined time.

44. (Previously Presented) A system according to claim 40, wherein to check whether the predetermined criterion is met, a periodic query is made to the home location register of the home mobile communications system of the subscriber terminal.

45. (Previously Presented) A system according to claim 38, wherein the data transfer device is configured to use the mobile subscriber identification data as the password to log in to the service access point.

46. (Currently Amended) A system configured to authenticate a user of a data transfer device, comprising:

a data transfer device;

a service access point that can be linked to the data transfer device over a first data transfer connection; and

an authentication server linked to the service access point over a second data transfer connection,

wherein

the service access point is configured to receive over the first data transmission connection identification data of a subscriber of a mobile communications system inputted from the data transfer device and to transmit the mobile subscriber identification data to the authentication server over the second data transfer connection,

the authentication server is configured to check from the mobile communications system over a third data transfer connection whether the mobile subscriber identification data contains an access right to the service access point and, if a valid access right exists, to generate a password and transmit the password to a subscriber terminal corresponding to the identification data of the subscriber of the mobile communications system,

the data transfer device is configured to use the password transmitted to the subscriber terminal in connection with login to the service access point, and

the authentication server is configured to transmit a user ~~ID~~-identification to the subscriber terminal corresponding to the identification data of the subscriber of the

mobile communications system and the data transfer device is configured to use the user ~~ID~~identification transmitted to the subscriber terminal in connection with login to the service access point.

47. (Currently Amended) A system configured to authenticate a user of a data transfer device, comprising:

a data transfer device;

a service access point that can be linked to the data transfer device over a first data transfer connection; and

an authentication server linked to the service access point over a second data transfer connection,

wherein

the service access point is configured to receive over the first data transmission connection identification data of a subscriber of a mobile communications system inputted from the data transfer device and to transmit the mobile subscriber identification data to the authentication server over the second data transfer connection,

the authentication server is configured to check from the mobile communications system over a third data transfer connection whether the mobile subscriber identification data contains an access right to the service access point and, if a valid access right exists, to generate a password and transmit the password to a subscriber terminal corresponding to the identification data of the subscriber of the mobile communications system,

the data transfer device is configured to use the password transmitted to the subscriber terminal in connection with login to the service access point, and

the authentication server is configured to transmit the user ~~ID~~identification via the service access point to the data transfer device over the first data transfer connection and the data transfer device is configured to use the user ~~ID~~identification transmitted to the data transfer device in connection with login to the service access point.
